PROFESSIONAL SUMMARY

I am a highly accomplished **Fullstack Software Engineer, Product Architect, and Security-Focused Systems Builder** with a strong multidisciplinary background spanning enterprise IT infrastructure, cloud-native application development, UX-driven product design, and large-scale web application architecture. With a professional foundation rooted in enterprise networking and infrastructure management, I have evolved into a product-focused engineering professional capable of leading the complete lifecycle of digital product development — from conceptualisation and UX strategy through systems architecture, backend engineering, deployment infrastructure, security design, CI/CD implementation, and production release management.

I specialise in designing and engineering **secure, scalable, and highly reliable web applications** with a strong emphasis on trust engineering, infrastructure resilience, payment workflow systems, authentication architecture, database optimisation, and modern cloud deployment practices. My work combines deep technical implementation expertise with sharp product thinking, allowing me to bridge business objectives with engineering execution at pace.

I have successfully designed and shipped multiple production-grade platforms across service marketplaces, payment protection systems, and trust-centred digital ecosystems. I also bring enterprise-grade networking and IT operations experience gained at the **U.S. Department of State – Overseas Buildings Operations (OBO)**, American Consulate Lagos — giving me a rare combination of field IT operations depth and modern software engineering breadth.

TECHNICAL SKILLS

Languages	- TypeScript - JavaScript - Python	- SQL - HTML5 - CSS3
Frontend	- React - Next.js - Tailwind CSS - Responsive Design	- PWA - State Management - Component Architecture - Accessibility
Backend	- Node.js - REST API Design - Serverless Architecture - Webhooks	- Auth & Authorization - Payment Integrations - Background Jobs

Databases	• PostgreSQL • Firebase Firestore • Neon • Aiven	• Data Modelling • Query Optimisation • Connection Pooling
Cloud & DevOps	• Vercel • GitHub Actions • CI/CD Pipelines	• Environment Config • Performance Monitoring • Infrastructure Reliability
Security	• Secure Auth Systems • RBAC • IAM • Payment Security	• API Protection • Fraud Prevention • Input Validation • Secure Deployment
Engineering	• Scalable System Design • Agile • Software Architecture	• Reliability Engineering • Product Thinking • Technical Documentation

PROFESSIONAL EXPERIENCE

Fullstack Software Engineer & Product Architect

Aug 2023 – Present

AssetMatrix / Independent Product Engineering

Lagos, Nigeria · Remote

I serve as sole Fullstack Engineer and Product Architect, taking full ownership of the end-to-end engineering, architecture, design, deployment, security implementation, and operational management of modern web-based products. I operate beyond the scope of a traditional developer role — actively shaping product strategy, UX architecture, infrastructure planning, scalability engineering, and trust-centred systems design from first principles to production launch.

- Architected and developed production-grade fullstack web applications using **Next.js, React, TypeScript, Node.js, PostgreSQL**, and **Firebase** — with full ownership from inception through production.
- Engineered robust **secure authentication systems** incorporating session management, email-based verification workflows, refresh-token rotation, and multi-layer identity protection mechanisms.
- Designed highly responsive and mobile-optimised interfaces with a strong focus on usability, WCAG accessibility standards, and trust-centred user experience patterns.
- Built scalable backend APIs and business logic systems capable of supporting complex multi-party transaction workflows and marketplace operations at scale.
- Implemented secure **payment processing workflows** and escrow-inspired transaction systems using Paystack — including webhook handling, idempotency controls, fund locking, and automated payout management.
- Designed and optimised **PostgreSQL database schemas** for serverless environments, including connection pooling via Neon and Aiven, query optimisation, and performant data access patterns.
- Developed and maintained **CI/CD pipelines** using GitHub Actions and Vercel to automate testing, preview deployments, and zero-downtime production releases.
- Applied modern security engineering principles: **RBAC, API rate limiting, input validation/sanitisation, CSRF protection, secure HTTP headers**, and full infrastructure hardening.
- Collaborated with business stakeholders to translate product requirements into executable technical specifications and iteratively shipped production-ready features.
- Maintained a consistent focus on engineering systems that inspire **user trust, operational reliability**, and long-term platform scalability.

Core Stack:

IT Specialist & Networking Engineer

Jul 2021 – Aug 2022

U.S. Department of State – Overseas Buildings Operations (OBO)

American Consulate Lagos · Victoria Island, Lagos, Nigeria

I worked as an IT Specialist and Networking Engineer supporting enterprise-grade infrastructure operations within a high-security, mission-critical environment at the U.S. American Consulate. My responsibilities encompassed network administration, systems reliability operations, infrastructure maintenance, and technical support within a structured and compliance-driven operational framework.

- Configured, monitored, and maintained enterprise networking infrastructure and server systems within a mission-critical diplomatic operational environment.
- Supported enterprise-grade network connectivity, structured cabling environments, secure communications systems, and endpoint management across the consulate campus.
- Troubleshoot complex network-related incidents, connectivity failures, hardware faults, and infrastructure performance issues — maintaining minimal downtime impact at all times.
- Participated in systems administration activities — including patch management, OS updates, account provisioning, and Active Directory management — to ensure continuous operational reliability.
- Collaborated with multidisciplinary technical and administrative teams to maintain secure, efficient, and compliant enterprise technology environments.
- Contributed to IT operational documentation, technical reporting, incident logs, and standard operating procedure (SOP) development.
- Supported implementation and maintenance of IT security protocols, access control policies, and compliance-aligned infrastructure best practices.
- Developed a security-first engineering mindset and deep appreciation for structured IT governance through exposure to U.S. government operational frameworks.

Key Exposure Areas:

KEY PROJECTS

TrustPoint — Secure Freelance Payment & Escrow Platform

Role: Founder · Product Architect · Sole Fullstack Engineer

TrustPoint is a trust-centred digital payment protection and transaction management platform I conceptualised and built to eliminate payment uncertainty between freelancers and clients. I owned the complete product lifecycle — from user research and UX planning through systems engineering, security implementation, and production launch.

- Designed the full product architecture and trust-oriented UX workflow — including multi-step contract creation, fund locking, milestone-based release, and dispute management flows.
- Engineered secure **escrow-inspired payment workflows** using Paystack — covering payment link generation, fund holding logic, approval triggers, and automated payout processing.
- Built protected transaction tracking with real-time status updates, webhook signature verification, and complete audit trail persistence in PostgreSQL.
- Architected Firebase Authentication with custom JWT session handling and secure role-based access between clients and freelancers.
- Implemented a mobile-first responsive frontend in Next.js and Tailwind CSS, focusing on trust signals, transparency indicators, and a friction-free payment experience.

- Applied end-to-end security engineering: HTTPS enforcement, webhook signature verification, environment-level secrets management, and API authentication middleware.
- Deployed on Vercel with automated preview and production pipelines via GitHub Actions — enabling continuous delivery with zero-downtime releases.

Anywork365 — Service Marketplace Platform

Role: [Sole Fullstack Engineer](#) · [Product Designer](#) · [Systems Architect](#) | [AssetMatrix](#)

Anywork365 is a scalable, trust-oriented service marketplace I engineered to connect users with skilled professionals across Nigeria and beyond. I served as sole developer and technical lead — responsible for architecture, engineering, deployment, UX, and security from the ground up.

- Led complete end-to-end development lifecycle: from wireframing and product architecture through backend engineering, deployment, and production launch.
- Designed intuitive UX flows and responsive interfaces optimised for accessibility, discoverability, and user engagement across service categories.
- Architected scalable fullstack systems with Next.js, TypeScript, and PostgreSQL — supporting service listings, provider profiles, booking workflows, and review systems.
- Developed robust authentication and onboarding systems with email verification, profile completion flows, and role-differentiated access controls.
- Built and optimised backend APIs supporting marketplace interactions, search and filtering, user management, and transactional service workflows.
- Engineered cloud-native deployment infrastructure on Vercel with automated CI/CD pipelines via GitHub Actions for continuous integration and staged releases.
- Optimised application performance through code splitting, image optimisation, serverless cold-start mitigation, and database query performance tuning.

AI & Cybersecurity Research Initiatives

Role: [Research Engineer](#) | [Ongoing](#)

I am actively exploring intelligent systems at the intersection of identity security, fraud prevention, and machine-learning-driven trust infrastructure — with a focus on fintech applications and emerging digital economies.

- Researching Identity & Access Management (IAM) architecture and zero-trust design patterns for modern web platforms.
- Exploring ML-powered fraud detection and behavioural anomaly analysis for payment and marketplace systems.
- Investigating AI-driven risk scoring and intelligent verification systems for digital trust infrastructure.
- Studying secure financial technology architecture patterns for underserved digital economies in emerging markets.

EDUCATION

M.Sc. Information Technology

2023

[University of the People](#)

Advanced information systems · Enterprise technology management · Software engineering principles · Systems architecture · Modern computing infrastructure.

B.Sc. Computer Science

2017

[University of the People](#)

Software engineering · Systems analysis · Networking · Databases · Algorithms · Programming · Distributed computing.

CORE ENGINEERING STRENGTHS

Secure Web Application Development

I bake end-to-end security thinking into every layer of the stack from day one.

Fullstack Product Engineering

I own the complete lifecycle from design concept through to production deployment.

Scalable Architecture Design

I build systems designed to grow gracefully under increased load and complexity.

Trust-Centred Product Thinking

I engineer platforms that earn and maintain user trust through reliability and transparency.

Payment & Fintech Systems

I bring deep experience designing secure payment flows, escrow logic, and financial trust infrastructure.

Cloud-Native Deployment Practices

I am proficient in serverless, edge deployment, CI/CD automation, and infrastructure reliability.

API Design & Backend Systems

I build clean, well-documented, performant, and secure RESTful API architectures.

Problem Solving & Systems Thinking

I bridge business complexity with pragmatic, maintainable, and future-proof technical solutions.

ADDITIONAL INFORMATION

- I am deeply passionate about engineering systems that increase digital trust, reliability, and security in emerging digital economies.
- I maintain a strong ongoing interest in cybersecurity, infrastructure engineering, intelligent fraud-prevention systems, and AI-driven identity verification.
- I continuously advance my knowledge in distributed systems design, cloud architecture patterns, secure API standards, and applied machine learning for fintech.
- I am experienced with modern Git-based collaboration workflows, feature-branch strategies, pull-request review processes, and production deployment governance.
- I am available for remote and hybrid engagements, and committed to delivering high-quality, maintainable, production-grade engineering outcomes.
